

Ex No: 9**DEADLOCK AVOIDANCE****Date: 01.04.2025****Aim:**

To find out a safe sequence using Banker's Algorithm for deadlock avoidance.

Algorithm:

1. Initialize work = available and finish[i] = false for all processes i.
 2. Find an i such that both:
 - finish[i] == false and
 - need[i] <= work
 3. If no such i exists, go to step 6.
 4. Update: work = work + allocation[i].
 5. Set finish[i] = true and go to step 2.
 6. If finish[i] == true for all i, then a safe sequence exists. Print the safe sequence.
 7. Else, print that no safe sequence exists (i.e., deadlock may occur).
-

Program Code (bankers.c):

```
#include <stdio.h>

#define P 5
#define R 3

int main() {
    int allocation[P][R] = {{0, 1, 0}, {2, 0, 0}, {3, 0, 2}, {2, 1, 1}, {0, 0, 2}};
    int max[P][R] = {{7, 5, 3}, {3, 2, 2}, {9, 0, 2}, {2, 2, 2}, {4, 3, 3}};
    int available[R] = {3, 3, 2};

    int need[P][R], finish[P] = {0}, safeSeq[P];
```

```
int work[R];

// Calculate Need matrix
for (int i = 0; i < P; i++)
    for (int j = 0; j < R; j++)
        need[i][j] = max[i][j] - allocation[i][j];

// Initialize work as available
for (int i = 0; i < R; i++)
    work[i] = available[i];

int count = 0;
while (count < P) {
    int found = 0;
    for (int i = 0; i < P; i++) {
        if (!finish[i]) {
            int j;
            for (j = 0; j < R; j++)
                if (need[i][j] > work[j])
                    break;
            if (j == R) {
                for (int k = 0; k < R; k++)
                    work[k] += allocation[i][k];
                safeSeq[count++] = i;
                finish[i] = 1;
                found = 1;
            }
        }
    }
}
```

```
        if (!found) {  
            printf("System is not in a safe state.\n");  
            return 1;  
        }  
    }  
}  
  
printf("The SAFE Sequence is:\n");  
for (int i = 0; i < P; i++)  
    printf("P%d ", safeSeq[i]);  
printf("\n");  
  
return 0;  
}
```

Sample Output:

The SAFE Sequence is:

P1 P3 P4 P0 P2

Result:

Thus, the Banker's Algorithm was successfully implemented to determine the safe sequence for deadlock avoidance.
